FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ANALYSIS FOR MINOR ISOTOPES DEUTERIUM, OXYGEN-18 IN NATURAL WATERS

Beijing KEXUE TONGBAO [SCIENCE BULLETIN] in English Vol 25 No 3, Mar 80
pp 209-212

[Article by Zhang Qinglian [1728 7230 5571]

[Text]

In the past forty-odd years my colleagues and I have carried out four series of experiments on the distribution of hydrogen and oxygen isotopes in various natural waters, and made corresponding investigations on the methods of analyzing these isotopes.

We started with the examination of the density variation of the water from some snow samples collected in North Europe in December, 1935 and found a depletion of heavier isotopes corresponding to a density difference about -4.2γ , where $\gamma = \mu\text{g}/\text{ml}^{(1)}$. At the same time we measured the vapor pressure ratio of HDO and H_2^{18}O vs. H_2O , and established the corresponding formulas for the temperature range from the melting to the boiling point of these isotopic forms of water⁽²⁾. These formulas yield a density decrease of -1.6γ for HDO and -2.4γ for H_2^{18}O at 0°C , the assumed temperature of evaporation of ocean water in cold winter. Thus, the total depletion is calculated to be -4.0γ , a value agreeing reasonably well with observations.

For the separate determination of the density variation due to the content of HDO and H_2^{18}O by the float method, we developed a method for the normalization of deuterium by means of laboratory hydrogen sulfide. A comparative measurement on samples and standards eliminated systematic errors.

With data then known on the abundance of deuterium and oxygen-18 in various species of natural water, chiefly snow, rain, land water, ocean water, crystal water of minerals, plant and animal water, we were able to sketch in 1936 the first figure for the cycle of the isotopic forms of water on the earth⁽³⁾.

In 1958-59, in a survey of the natural waters in China, we collected about 50 samples, which were grouped as waters from sea, river, underground, spring, hot spring, lake, plateau lake, salt lake and oil brine. The result of analysis showed that the waters of salt lake and oil brine were considerably enriched with heavier isotopes⁽⁴⁾. Only a few samples were separately analyzed for deuterium and oxygen-18 after normalization with laboratory carbon dioxide. This known method was bettered

by means of a parallel arrangement for the reference water and the sample to be measured so as to eliminate systematic errors⁽¹⁾.

A third series of measurements were undertaken in our laboratory after we had collected, in 1966 and 1968, ice, snow and water samples in the region north of Mt. Zhumulangma at altitudes from 4.5 to 7 km. Nineteen different samples were grouped as glacial ice, pack snow, river and lake, lake on glacier, soaked ice, and spring water. In all the waters investigated, the contents of deuterium and oxygen-18 were lower than those in standard mean ocean water, SMOW. In general, deuterium was comparatively less depleted in the solid than in the liquid phase. With regard to isotopic altitude effect, age effect, profile isotopic composition and isotopic composition in a plateau lake, the data observed were in conformity with the environmental factors⁽¹⁾.

In connection with this investigation, we improved the method of normalizing the oxygen isotopes with purified tank oxygen with manganese dioxide as catalyst at 600°C. Oxygen was conducted under pressure through a saturator containing the water sample at 60°C. The gas mixture after the equilibration was chilled with a trap for the recovery of water. The saturator and trap took exactly the same form and could function alternately by suitable adjustment of clamps. Thus, a succeeding procedure could be carried out in the reverse order, and would suffice for a comparative analysis of the sample and the reference water.

On the other hand, we developed in the sixties a temperature-pressure float method, in which a 16 mm spindle-shaped borosilicate glass float was situated in a 2.5 ml chamber with a conical bottom for centering the float. The chamber was closed with a ground glass stopper with capillary tubing to accommodate the expansion of water. The top of the chamber had an upper extension as the body of flotation tube, which after the degassing of the sample would again contain the re-admitted air, that could nevertheless diffuse no more into the chamber during the measurement. With a thermostat constant to $\pm 0.001^\circ\text{C}$, an accuracy of $\pm 0.2\gamma$ was readily obtainable.

The fourth series of measurements followed the second ascent from the north slope to the summit of Mt. Zhumulangma in the summer of 1975. Ten samples of snow and ice were collected by the mountaineers at altitudes from 7050 m at the North Col up to the summit, which at an altitude of 8848 m is the pinnacle of the entire earth crust. The locations of these samples are shown in Fig. 1. Five samples from the North Col represented a profile of small depth.

Deuterium was determined with a mass spectrometer of Model M-86, while oxygen-17 as well as -18, with that of Model MAT-CH5. The former instrument was calibrated with hydrogen gas converted from water samples prepared from waters containing 1.05 ± 0.04 ppm D and 99.710 ± 0.013 atom% D.

Methods for the conversion of water samples into inlet gases of hydrogen and oxygen were worked out⁽¹⁾. Water was decomposed at 550°C by pure magnesium filings which were previously degassed in high vacuum at about the same temperature, since the metal occluded deuterium at a higher concentration than that in ordinary

Fig. 1. Four locations of sampling being indicated by the camps from the North Col upward, one between the lowest two of these, and another at the summit.

water. Thus, we could accurately analyze the sample of snow collected from the summit on May 27, 1975, the deuterium content of which was 123.2 ppm, or $\delta D(\text{‰}) = -208.8$. These two values, being separately determined, are in conformity with the experimental result of Hagemann et al. for the atomic ratio of D/H in SMOW⁽¹⁰⁾.

The conversion of water sample into inlet oxygen gas was effected by electrolysis on a pure gold anode in 16 ml of a 0.1 M sodium fluoride solution at 20°C. Small fractions of oxygen gas, each being produced by a current of 250 mA for 9 min, were collected after removal of water vapor with trap. The first 4 portions were discarded, since they might be contaminated with residual dissolved air, although the cell was filled with nitrogen before the electrolyte was syringed. The following 7 samples were analyzed mass-spectrometrically with an electron emitter made of a pure rhenium strip 0.04 mm thick, 0.7 mm wide and 7 mm long. With an ignition current of 600 μ A, it could work for 200 hr⁽¹⁰⁾. The pressure of oxygen in the ionization chamber was 2×10^{-4} torr, while the ion current of mass 32 amounted to 2×10^{-3} A. By means of alternate operation on the sample and the standard, and the service of a cup-cup double collector, the masses 32 and 34 were recorded on a compensograph. By the way, we determined the separation factor of ^{18}O on gold anode as 1.0076, while the known value in related literature is 1.0094. The mass 33 was measured by re-adjusting the cup position. After correction was made for the bias of the instrument, the δ value was obtained from the mass current ratio.

For the summit snow, $\delta^{18}\text{O}(\text{‰}) = -26.99$, corresponding to the ^{18}O content of 1946.5 ppm according to the new determination made by Baertsch for the $^{18}\text{O}/^{16}\text{O}$ ratio in SMOW⁽¹⁰⁾.

Fig. 2. A plot of $\delta^{18}\text{O}$ and $\delta^{16}\text{O}$ vs. δD of snow and ice at altitudes from 7050 up to 8848 m.

Table 1
 δD , $\delta^{18}\text{O}$ and $\delta^{16}\text{O}$ of the Snow and Ice at Altitudes From 7 km up to the Summit

Altitude (m)	Precipitation	Date (1975)	δD (‰)	$\delta^{18}\text{O}$ (‰)	$\delta^{16}\text{O}$ (‰)
8848	New snow	27/5	-208.8	-13.82	-26.99
8000	Surface snow	ca. 23/5	-186.2	-9.17	-18.79
8100	Granular snow	20/4	-82.2	-6.28	-12.57
7600	Ice	ca. 20/4	-22.8	-1.86	-4.81
7450	Granular snow	21/4	-62.0	-5.25	-9.43
7050	New snow	22/3	-127.7	-9.97	-19.37
7050	Old snow	22/3	-135.8	-10.50	-20.72
7050	Granular snow	22/3	-144.1	-11.07	-21.60
7050	Pack snow	22/3	-121.7	-8.53	-17.48
7050	Ice	22/3	-154.7	-10.83	-20.99

The overall results of analysis are shown in Table 1, where we express the data conventionally as δ (‰) with SMOW as reference. The corresponding data appearing in a previous article⁽¹¹⁾ have been re-calculated. One notices that all δ 's were negative. Fig. 2 shows a plot of $\delta^{18}\text{O}$ and $\delta^{16}\text{O}$ vs. δD . The following formulas hold approximately:

$$\delta\text{D} = 14.5 \delta^{18}\text{O}, \quad \delta\text{D} = 7.0 \delta^{16}\text{O}.$$

Such ratios between δ 's conform with those calculated from the vapor pressure formulas at a temperature about 30°C, which seems to be too high. Furthermore, the maximum depletions observed were about twice as large as those resulting from a single process of evaporation, therefore secondary processes must have occurred.

In recent years we have been interested in preparing some reference samples for deuterium, oxygen-18 and other light isotopes. For example, we possess a reference sample of untreated Beijing University tap water BU76, collected on January 8, 1976. It has a deuterium content of 145.7 ± 0.3 ppm D, and $\delta^{18}\text{O} = -9.09\text{‰}$. Besides, we collected altogether 12 samples, one each month around the 20th from January to December in the year of 1978. The untreated tap water was analyzed with the MAT-CH5 instrument by the carbon dioxide equilibration method. The oxygen-18 content was found to be constant within an experimental error of $\pm 0.2\text{‰}$. For this equilibration method, it is important to determine accurately the exchange equilibrium constant for ^{18}O at 25°C , the best value of which known up to date is 1.0412 ± 0.0001 , reported by O'Neil et al.^[12]. We have checked this value by experiment, and the value we found is 1.0411 ± 0.0002 at 25°C ^[13].

For the conversion of water samples into inlet gas hydrogen, we obtained good results with the uranium decomposition method devised by Bigeleisen^[14]; working with a mass spectrometer of Model MM-602D, we achieved an accuracy of 1‰ for δD . On the other hand, the BrF_3 method of converting water into inlet gas oxygen described by Clayton et al.^[15] was tested, and our experimental errors were within 0.2‰ for $\delta^{18}\text{O}$.

CHINA'S FIRST KARST GEOLOGY INSTITUTE ESTABLISHED IN GUILIN

Beijing GUANGMING RIBAO in Chinese 5 Aug 80 p 1

[Article by Wei Zhimin [7614 1807 3046]]

[Text] After 3 years of planning, the building of the Institute of Karst Geology of the Ministry of Geology, China's first national organization specializing in the research of karst topography and located in Guilin City, is almost complete, aside from the museum of karst geology, which is included in the basic construction work.

China is a country rich in limestone-carbonate rocks and has extensive areas of karst topography distribution. According to preliminary statistics, the area of distribution of exposed carbonate rocks reaches 1,200,000 km², amounting to about one-eighth of the area of the country; if the covered and buried karst areas are included, the total would be more than 2,000,000 km², about one-fifth of the area of the country. In national economic construction, such as hydroelectric projects, road building and repair, mining and mine construction, industrial, mining, and agricultural water supplies, industrial, civilian, and defense construction projects, etc.; therefore, many complex problems of karst topography are often encountered and in need of resolution. At present, China's research work on karst is still a great distance from satisfying the urgent needs of industrial and agricultural production. For the purpose of strengthening the study of karst geology, the state resolved to build an institute of karst geology in Guilin where the types of karst topography, and their morphology are both typical and complete, for the purpose of "developing studies on the principle of karst development and its utilization and reconstruction." This subject has been listed as one of the key items in the national science and technology development plan outline, 1978-1985. This research institute will emphasize both the basic theoretical study and study on the application of karst. Currently, karst hydrology and karst engineering geology will be the major fields of research, while at the same time studies on some karst caverns and karst mineral deposits will be launched.

With respect to karst theory, studies will be carried out primarily on melting and erosion mechanism and theory, the hydrokinetic zoning theory,

and the effects of geotectonics, geomorphology, and glacier on the development of karst. Although these studies are aimed at the entire country, the emphasis will be on the southern provinces of karst development. In the past 3 years, while the institute was being constructed, in connection with the key subjects of the national science and technology development plan outline, the major subjects of study have included: the principle of karst development in Guilin-Yangshuo and its hydrology and engineering geology, a study on the environmental geology and protection of water resources of Guilin City, principle of development of karst in Luotian of Hunan Province, and its utilization and reconstruction, a study on the application of remote sensing technology in karst geology research, etc. Preliminary results have been obtained in all these subjects.

TITLE: "Robustness of Kinescope Glass Shell"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 1-13

TEXT OF ENGLISH ABSTRACT: The problem of robustness of the kinescope glass shell is discussed in detail in this paper. First, the main causes of explosion of the glass shell are analyzed. The author points out that the robustness of the glass shell depends on the distribution of residual stress and that of the structural stress in the shell. Experimental methods for determining the residual stress and structural stress in the glass shell are described. The problem of stress concentration caused by the air bubble in the shell is discussed. A tentative idea of how to use the method of fracture mechanics to study the effect of macroscopic defects of the glass shell is proposed. Finally, the principles of design for preventing explosion of the kinescope glass shell are presented.

TITLE: "An Experimental Study of ZDB-150 Type Cryogenic Vacuum Pump with Closed-Cycle Refrigerator"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 14-22

TEXT OF ENGLISH ABSTRACT: Cryogenic pumping represents the latest method in high and ultra-high vacuum-obtaining techniques. It has the advantages of high pumping speed, freedom from hydrocarbon contamination, and adaptability to a wide range of operating pressures. This paper deals with the design concepts, the actual construction and the main performances of ZDB-150 type cryopump. In the free molecule flow region the pumping speed is greater than 650 l/sec and 1400 l/sec for air and hydrogen respectively. The ultimate pressure is less than 6×10^{-10} torr. The two-stage G-M closed-cycle refrigerator provides 2.5 watts at 15 K for the second stage and 25 watts at 70 K for the first stage. A comparison between the performances of the ZDB-150 cryopump and some other commercial types is listed at the end of this paper.

TITLE: "Investigation of a Long-Life CO_2 Laser with CaCO_3 as Supplier"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 23-28

TEXT OF ENGLISH ABSTRACT: This paper describes the problem of using CaCO_3 as a supplier of CO_2 to compensate for its loss by dissociation and thereby to prolong the lifetime of a CO_2 laser. The relation between the equilibrium pressure of CaCO_3 and the laser output characteristics is also investigated.

TITLE: "A General Analytic Method of Solving Mixed Lumped-Distributed Networks"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 29-42

TEXT OF ENGLISH ABSTRACT: In this paper the uniform transmission line is considered as a four-terminal element, and the formula for its Y-parameters against the external circuit is derived. Using these parameters the author suggests a general analytic method of solving the mixed lumped-distributed networks, and a transmission-line transformer is taken as an example of its application. The result thus obtained gives a theoretical explanation of the wideband characteristic of the transmission-line transformer.

TITLE: "A Computational Method for Stability Analysis of Linear Control Systems"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 57-61

TEXT OF ENGLISH ABSTRACT: A computational method for stability analysis of linear control systems is presented. The state-variable matrix of a linear system is first transformed into an equivalent upper Hessenberg matrix. This reduction of the system matrix to the Hessenberg form may be achieved by the use of either stabilized elementary matrices or elementary unitary matrices. The upper Hessenberg matrix is then transformed into a Schwarz matrix. The stability of the system is analyzed on the basis of the well-known property of the Schwarz matrix. The suggested method is also useful for computer-aided feedback synthesis of multivariable linear control systems.

TITLE: "Design and Operation of Submerged-Combustion Evaporator"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 69-79

TEXT OF ENGLISH ABSTRACT: This paper is a summary of the design and operation of a submerged-combustion evaporator. This technique can attain three aims: to recover the spent hydrogen to be used as fuel for evaporation; to raise the concentration of NaOH liquor; and to recover the exhaust gas, which is relatively pure nitrogen, to be used as protective gas. This useful technique has not been widely adopted in our country because of the lack of safety measures.

In this paper the condition of stability of the submerged combustion and the factors causing explosion are analyzed. A design principle to reduce the pressure fluctuation and some safety measures against explosion are proposed.

TITLE: "Research on Artificially Generated Earthquake Records"

SOURCE: Nanjing NANJING GONGXUEYUAN XUEBAO [JOURNAL OF NANJING INSTITUTE OF TECHNOLOGY] in Chinese No 2, 1980 pp 80-89

TEXT OF ENGLISH ABSTRACT: In this paper, a survey is made of the research works on artificially generated earthquake records. For structural design purposes, the author proposes a method of creating artificial earthquake acceleration-time records which are compatible with a given smooth design spectrum, and develops a corresponding computer program. This presupposes that the ground motion in an earthquake consists of a linear combination of various harmonic motions with stochastic phase angles. The amplitudes of the Fourier spectrum are then modified step-by-step until the amplitudes of the response spectrum of the artificially generated earthquake record match the given design spectrum most closely. The resulting artificial time records are representative of the given earthquake intensity and design spectrum, and will provide a reliable basis for the aseismic design of important engineering structures.

TITLE: "The Optimal Fast Turbine Valve Control and Its Experimental Research on Micro-Alternator System"

SOURCE: Beijing ZHONGGUO KEXUE [SCIENTIA SINICA] in English Vol 23 No 7, Jul 80, p 923

TEXT OF ENGLISH ABSTRACT: This paper suggests a plan of optimal fast turbine valve closed-loop control for large turbo-generator in long-distance transmission system. It is proved, not only from theoretical analysis and calculations but also through experiments on a micro-alternator system, that the fast turbine valve controller designed according to the linear optimal control theory can markedly increase the transient stability limit of the transmission system under temporary or permanent fault conditions and greatly improve the dynamic quality during the post fault period. An important characteristic of the

[Continuation of ZHONGGUO KEXUE Vol 23 No 7, Jul 80]

suggested control plan is that it can adjust itself to distinguish and suit the changes of different fault conditions, which can hardly be obtained by the fixed logical open-loop control plan.

TITLE: "Abundance of Flowers and Giant Fruits of Environmental Research"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 1-2

ABSTRACT: If problems of environmental pollution are not resolved or not resolved well, the progress of socialist construction will be affected, China's reputation will be affected, and the people's health will be damaged. In 1972, the Chinese Academy of Sciences began to organize scientists of various fields to participate in scientific research for environmental protection. Since then, 20 first prizes and 2 second prizes have been awarded by the National Science Conference, and 12 important fruits of science and technology prizes awarded by Chinese Academy of Sciences with respect to regional environmental surveys and studies on environmental quality. The paper reviews various advances in studies on the accumulation, conversion, metabolism, and decomposition of mercury, cadmium, lead, zinc, and agricultural drug contamination, the effective use of activated charcoal, catalysis, membrane technique, extraction separation, and microbiological methods of direct elimination of sources of pollution, and aspects of effects of environmental pollution on human health, in these years, especially since 1977.

TITLE: "Do a Good Job of Economic and Technical Assessment of the Environment"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 7-8

ABSTRACT: Mankind's activities of developing production and improving livelihood are limited by the natural environment on the one hand and are causing changes of the natural environment on the other. An assessment of the quality of the natural environment at a factory or a water system is for the purpose of protecting the environment, with the development of production, improvement of livelihood, and contributing to the welfare of the people as the final goal. Assessment for the purpose of assessment just will never do. The evaluation must be of the entire environment, including, aside from the natural environment, the social and political environment as well. The economy is the foundation of politics and the key to scientific and technological development, and the basis for cultural environment as well. In the past, the concept of environmental assessment was limited to natural or ecological evaluation. An account of the damages of 3 wastes was made, but not the material and energy contents of the 3 wastes. There was only an account of cost estimate for treatment and control, but not the benefits. This paper points out the various economic benefits of environmental protection measures.

TITLE: "A New Procedure of Closed Cycling of White Liquid Waste of the Paper Making Process"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 18-20

ABSTRACT: Tianjin Paper Mill uses primarily Phragmites communis Trin. as the raw material, steamed in magnesium hydrogen sulfite, and bleached with calcium chlorate to produce paper. A large quantity of water is consumed in the production processes. In the past, the plant discharged 50,000 m³ of liquid waste to create serious pollution problem for Haihe, which is the source of drinking water for the city, and the nearby Bohai Bay. An analysis of the quantity and the content of the liquid waste indicates that it is divided into 3 types: the black cooking waste, the bleaching waste, and the waste of the paper-making machine. The last type, the white liquid, amounts to 3/4 percent of the total quantity, and has a relatively simpler content. A technique has been adopted by the mill to use a flocculant to cycle the white liquid before re-using it in the paper-making machine. This technique of closed cycling is reported.

TITLE: "Radioactive Level of Phosphorus Fertiliser and Its Effect on Water"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 23-25

ABSTRACT: The phosphorus fertilizers used in China are mainly calcium perphosphate, processed from apatite, which is mostly accompanied with trace quantities of natural radioactive elements, mainly uranium, with some thorium and radium, which become part of the phosphorus fertilizer. Experimental data indicate that the uranium content of the fertilizer varies between $0.13 \mu\text{g} - 170 \mu\text{g/g}$, the thorium content $1.1-12.0 \mu\text{g/g}$, while the radium content is relatively minor. Due to loss of phosphorus fertilizer, water of nearby streams may have a high concentration of phosphorus as well as uranium. This paper reports the U, Th, and Ra contents of Zhangjiakou, Loyang, and Zhanjiang region phosphorus fertilizers being sold in the markets and contents of P, U in 4 nearby streams. Spalding's report of a study on the subject in Mexico Bay is quoted for comparison.

TITLE: "Migration and Conversion of Heavy Metal Elements in Bodies of Water"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 33-35, 41

ABSTRACT: Many heavy metals are known to be environmental pollutants, but in the complex natural environment, states of metals change yet they cannot be biodegraded; therefore, they can be easily concentrated in organisms. In bodies of water, although the solubility of metals is low, the complexing ability is very high. They can easily be attached to organic or inorganic colloids. Some heavy metals may also leave the water and disperse into the atmosphere. This paper attempts to discuss the following problems: (1) In what direction do heavy metals migrate? (2) How do they migrate? (3) What changes are occurring in the process of migration? (4) Are this type of migration and conversion harmful or beneficial to the human environment? The purpose of the discussion is to dispel certain blind optimism concerning the subject matter.

TITLE: "Preventing the Tragedy of Minamata Disease to Reappear On the Banks of Songhuajiang"

SOURCE: Beijing HUANJING BAOHU [ENVIRONMENTAL PROTECTION] in Chinese No 2, 80 pp 40-41

ABSTRACT: The problem of pollution in Songhuajiang has grown to be more and more serious since 1958. In the 300 km section of the river below Kirin City, fish can basically no longer be observed. The leftover fish, containing methyl mercury far exceeding the limit of 0.3mg/kg standard set in China is definitely harmful to humans. Signs of Minamata disease have already appeared on the banks of Songhuajiang. The close to 100 tons of mercury discharged into the river in the past 2 decades has mostly settled to the bottom of the river to release methyl mercury into the water continuously, while the sediments are continuously being moved down stream during every flood season. This paper seeks to bring the situation to public attention. A 7-point proposal to protect the water system and to prevent further development of the Minamata Disease tragedy is included.

TITLE: "Analysis of the Staggered Parallel Blasting in Hot Stoves"

SOURCE: Beijing GANTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 1-8

TEXT OF ENGLISH ABSTRACT: The increase of hot blast temperatures by means of staggered parallel blasting in hot stoves is discussed.

Through a simulated study, it has been theoretically proved that two stoves staggered parallel on blast have a higher thermal efficiency than does a single stove on blast. The thermal load is also higher than that of a single stove and the dome temperature is lower. The fundamental concepts relating to a high temperature blasting operation are described.

The amount of heat required for the next blast cycle and the time available to get optimum results are calculated with the aid of a computer. The gas/air ratio and their individual flows are controlled for effective combustion in the hot stove in the staggered parallel blasting model. The staggered parallel

[Continuation of GANTIE No 1, Jan 80 pp 1-8]

blasting model is used to control the hot blast temperature. The computer controls the volume distribution between the stoves on blast by directly controlling the cold blast regulating valves.

TITLE: "The Interaction of Supersonic Jet on Liquid Bath in Oxygen Steel-making"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 14-19

TEXT OF ENGLISH ABSTRACT: This paper summarizes the results obtained from experimental model studies on the behavior of supersonic oxygen jet in top-blown steelmaking converters, especially the interaction of the jet on the liquid bath. Laboratory experiments are performed in accordance with the similarity theory. Representative results, such as axial velocity decay and lateral velocity distribution of the supersonic oxygen jet as well as its penetration depth and impact area on the liquid bath have been obtained. Mathematical models have been established from these results for scale-up to commercial furnaces. A large number of experimental heats on a hot model were carried out in combination with a study on possible reduction of smelting time on a five-ton converter at the Capital Iron and Steel Company in Beijing. The results

[Continuation of GANGTIE No 1, Jan 80 pp 14-19]

proved that an average oxygen blowing time per heat may be reduced from 14 minutes to 12 minutes under otherwise equal conditions.

TITLE: "Mechanism of Removal of Non-Metallic Inclusions in the ESR Process"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 20-26

TEXT OF ENGLISH ABSTRACT: ESR is one of the most effective means of removing non-metallic inclusions from steel. Much controversy exists regarding the mechanism of slag removal in the ESR process.

The ESR process consists of three stages: 1) Formation of droplets on the electrode tip; 2) Droplets falling through the slag; 3) Collection of the metal in a pool at the top of the ingot.

In order to find out which is the main step in the refining process, samples are taken from the solid electrode, the molten film on the electrode tip, metal droplets in the slag layer and the final ingot, and quantitative determination of inclusions made by metallographic, chemical and radioisotopic (indicator $Zr^{95}O_2$) methods.

[Continuation of GANGTIE No 1, Jan 80 pp 20-26]

From the results obtained it is concluded that the removal of non-metallic inclusions occurred mainly at the electrode tip. Results of experiments on industrial furnaces have confirmed this conclusion.

TITLE: "X-Ray Analysis of the Aging Process in 18 Ni Maraging Steels"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 27-34

TEXT OF ENGLISH ABSTRACT: 18 Ni maraging steel possesses relatively high strength and toughness. In this study the substructure, reversely transformed austenite and regularities of changes in lattice parameters during aging are determined by X-ray diffraction. It is shown that after aging treatment at various temperatures below 520°C for three hours martensite matrix has stability of fine substructure and reversely transformed austenite dispersively precipitates at 480°C. The appearance and disappearance of this austenite are accompanied by the growth and refinement of the substructure. These structure parameters explain regularities of changes in mechanical properties and serve as reference data for selection of heat treatment and softening regimes.

TITLE: "The Determination of the Plane Strain J-Integral Crack Extension Resistance Curve"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 35-41

TEXT OF ENGLISH ABSTRACT: In the present paper the plastic part of the J-integral was derived based on the model of pure power hardening materials. The new expression found was $J_p = -\frac{U_p}{B} \left(\frac{1}{P} \frac{\partial p}{\partial a} \right)_\Delta$. An attempt was also made to elucidate the theoretical basis and the approximacy nature of the expression in current use $J_p = \frac{2U_p}{B(w-a)}$. This latter expression could be arrived at by assuming $\left(\frac{1}{P} \frac{\partial p}{\partial a} \right)_\Delta \approx \left(\frac{1}{P_L} \frac{\partial P_L}{\partial a} \right)$ and substituting it in the new expression. In this paper J-integral curves of four kinds of materials were quoted from our

[Continuation of GANGTIE No 1, Jan 80 pp 35-41]

laboratory. It was found from the curves that: (1) within quite a wide range of the specimen sizes the plane strain resistance curve seems to be an inherent characteristic of the materials; (2) to the composition, heat treatment and microstructure of the materials tested, the crack initiation toughness is not as sensitive as the resistance curve; (3) for predicting K_{Ic} of a large specimen with the aid of the resistance curve, different points thereon should be used for the two types of materials. For one type, K_{Ic} is related to the highest point (saturation point), for the other type to the initial point of the resistance curve.

TITLE: "Eccentricity of Wheels in Hot Rolling"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 49-58

TEXT OF ENGLISH ABSTRACT: There is always eccentricity in pressed and rolled wheels, which adversely affects their use, service life and cost. There are many points of view about eccentricity of wheels. According to the production technology of wheels, we have analyzed blanks for wheels worked after every operation under the same conditions. The analysis shows that in blanks formed on 8000 t hydraulic press there are two different centers for inside and outside hubs. After rolling the blanks have three centers, two for inside and outside hubs and one for internal diameter of inside and outside rims. After coning wheels with four centers are obtained, i.e., two centers for inside and outside hubs and two centers for inside and outside rims.

The authors came to the conclusion that it is important and necessary to control the atmosphere in the heating furnace, to remove the scale by high pressure

[Continuation of GANGTIE No 1, Jan 80 pp 49-58]

water, to improve the structure and hydraulic system of the platform for the hydraulic press and to improve the impressing mechanism of 3000 t hydraulic press as well.

TITLE: "On the Metallurgical Problems of Some Precipitation Hardening Stainless Steels"

SOURCE: Beijing GANGTIE [IRON AND STEEL] in Chinese No 1, Jan 80 pp 59-64

TEXT OF ENGLISH ABSTRACT: Though precipitation hardening ultra high strength stainless steels have been developed for decades, the development of space science, modern defense and some important civil applications stimulates new grades to appear successively. The history, present status and outlook of precipitation hardening ultra high strength stainless steels are briefly described. Works about the influence of metallurgical factors, especially physical metallurgy, on the properties of this type of steel abroad are reviewed. Managing stainless steels developed since the 60's and means of improving their toughness are emphasized. Considerations about the development of new grades of precipitation hardening ultra high strength stainless steels are proposed.

TITLE: "A Class of Operators and the Spectral Theory (II)--The Restriction and Quotient of (AC) Operator"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 1-9

TEXT OF ENGLISH ABSTRACT: This paper is a continuation of a previous paper. We investigated the heredity of (AC) operator which is on a spectral maximal space. We have proved that: (1) If $T \in \mathcal{B}(\mathcal{X})$ is (AC) operator, and \mathcal{Y} is a spectral maximal space, then the restriction $T|_{\mathcal{Y}} \in \mathcal{B}(\mathcal{Y})$ of T on \mathcal{Y} and the quotient operator $T^{\#} \in \mathcal{B}(\mathcal{X}/\mathcal{Y})$ induced by T on \mathcal{X}/\mathcal{Y} is the (AC) operator. (2) If $T \in \mathcal{B}(\mathcal{X})$ is a decomposable operator, and \mathcal{Y} is a spectral maximal space, the quotient operator $T^{\#} \in \mathcal{B}(\mathcal{X}/\mathcal{Y})$ induced by T on the quotient space \mathcal{X}/\mathcal{Y} is a decomposable operator. This is a positive answer to the open question of I. Colojoara and C. Foias.

TITLE: "The Semigroup Approach to Cauchy Problem for the System of Gas Dynamics with a Viscosity Term"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 10-18

TEXT OF ENGLISH ABSTRACT: In this paper we consider the Cauchy problem for the system of gas dynamics with a viscosity term $u_t + [p(v)]_x = \mu u_{xx}$, $v_t - u_x = 0$. By means of the theory of nonlinear semigroups, we have proved the existence and uniqueness of the generalized solution of this problem. It follows from the Sobolev imbedding theorems that the generalized solution is in fact a classical solution provided the initial data and the function $p(v)$ are of appropriate smoothness.

TITLE: "On the Nonlinear Boundary Problems for Quasilinear Elliptic and Parabolic Equations"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 19-46

TEXT OF ENGLISH ABSTRACT: In this paper, the nonlinear boundary value problems

$$\sum_{j=1}^N d_j(x) \frac{\partial u}{\partial x_j} = \varphi(x, u)$$

are considered for quasilinear elliptic and parabolic equations

$$\sum_{i,j=1}^N a_{ij}(x) \frac{\partial^2 u}{\partial x_i \partial x_j} + f(x, u, \frac{\partial u}{\partial x_1}, \dots, \frac{\partial u}{\partial x_N}) = 0,$$

$$\sum_{i,j=1}^N a_{ij}(x, t) \frac{\partial^2 u}{\partial x_i \partial x_j} + f(x, t, u, \frac{\partial u}{\partial x_1}, \dots, \frac{\partial u}{\partial x_N}) = \frac{\partial u}{\partial t}.$$

Different sufficient conditions are obtained for the existence of solutions for these problems. In the parabolic cases, the so-called "supplementary

[Continuation of JILIN DAXUE ZIRAN KEXUE XUEBAO No 1, 1980 pp 19-46]

function" methods are used to obtain the interior and boundary estimates of derivatives of solutions, for differential equations and approximating difference-differential equations. Furthermore, problems of periodic solutions without initial conditions, of continuous initial values and of domain with infinite time are studied.

TITLE: "The Optical Model Analysis of Fast Neutron Scattering for ${}^6,{}^7\text{Li}$ "

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 47-54

TEXT OF ENGLISH ABSTRACT: This paper has systematically analyzed the fast neutron scattering data for ${}^6,{}^7\text{Li}$ by means of the optical model method. The incidence energy is 4.83-15 MeV and 7-15 MeV for ${}^6\text{Li}$ and ${}^7\text{Li}$ respectively, and the data analyzed include total cross section, elastic cross section and angular distribution. The result obtained is in good agreement with the experimental data. The optical potential we use is of the Woods-Saxon type with surface absorption and spin-orbit coupling. We choose diffusion parameter of the real part and surface absorption depth as energy dependent parameters which vary with incidence energy linearly. All other parameters are independent of energy and, in addition, they are the same for ${}^6\text{Li}$ and ${}^7\text{Li}$. We discovered that the diffusion parameter of the real part slowly decreases with the increasing of incidence energy.

TITLE: "The Potential Functions of Interatomic Interaction and the High-Pressure Equations of State for Zinc and β -Brass"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 69-79

TEXT OF ENGLISH ABSTRACT: In the present paper, the potential functions of interatomic interaction for zinc and perfect-ordered CuZn alloy are dealt with by using the experimental data of lattice parameter, sublimation and formation heat, and compressibility (or elastic constant). The four typical Gruneisen constants-volume relations and their high-pressure equations of state are calculated. The high-pressure equation of state for nearly perfect ordered β -brass has been discussed, with the ordered parameter introduced. The theoretical calculation of the high-pressure equation of state for zinc and the experimental results of the shock wave are found to be agreeable (the deviation is less than 6 percent near 500 kb).

TITLE: "On the Theory of Chemical Bond in Transition-Metal Dinitrogen Complexes (II)"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 83-95

TEXT OF ENGLISH ABSTRACT: In this paper the stabilization energy, charge density on the nitrogen atoms, and bond order between the two nitrogen atoms of trinuclear transition-metal dinitrogen complexes, in which N_2 had been coordinated to the metals in different forms, are calculated and discussed by using the methods of HMO and graph theory. It is found that the varying tendencies of charge density on the N atoms in trinuclear dinitrogen complexes are similar to those in mononuclear and binuclear dinitrogen complexes. However, the varying tendencies of stabilization energy of trinuclear dinitrogen complexes are different from those of mononuclear and binuclear dinitrogen complexes. From the calculated results, it is deduced that coordinating activation of N_2 by nitrogenase may be the concerted effects of multinuclear cluster involving both end-on and side-on coordination.

TITLE: "On the Method of Analyzing the NMR Spectra in Liquid Crystal Solvents"

SOURCE: Jilin JILIN DAXUE ZIRAN KEXUE XUEBAO [NATURAL SCIENCE JOURNAL OF JILIN UNIVERSITY] in Chinese No 1, 1980 pp 103-124

TEXT OF ENGLISH ABSTRACT: In this paper, the topic on the method of analyzing the NMR spectra in liquid crystal solvents is briefly reviewed from a more unified point of view, although the major parts are mainly out of the treatise written by Emsley and Lindon as well as some other articles in this field. However our discussions are limited to those systems that can be solved exactly to give solutions with closed analytical forms. No attempt has been made to discuss the numerical methods by using computer simulation.

This review includes three parts: In part (1) we concentrate our attention on discussing the method of getting the general expressions of AB_n and AB_nX spin systems. Systems of A_n , AB , AB_2 , AB_3 , ABX , in Emsley's treatise are all the special cases of our general expressions. In part (2), $AA'A''A'''$ system with

[Continuation of JILIN DAXUE ZIRAN KEXUE XUEBAO No 1, 1980 pp 103-124]

C_{3v} symmetry is discussed in detail for illustration. In part (3) we deal with the spin systems having quadrupolar nuclei and then the expressions obtained in a unified fashion. Some mistakes occurring in the original reference books and papers are corrected as well.

TITLE: "On the Nature of Higher Order Functions and Operators"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 1-10

TEXT OF ENGLISH ABSTRACT: In restricted predicate calculus we deal with functions, namely, the thing functions, which take individuals as values, and the propositional functions, i.e. predicates. Usually they take only individuals as arguments. Such a restriction seems, however, too severe. It would be better if we were to allow them to take propositions also as arguments. In addition, we also deal with operators, namely, quantifiers and descriptions. By the same reason, it would be better if we were to allow them to also take terms as their scopes and to take propositional variables as the directive variables. Further, in the extended predicate calculus, we also deal with functions of higher order and operators of higher order. We usually consider them to be quite different from each other.

In the present paper we show that: First, the functions of the second order

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980 pp 1-10]

are the same as the operators of the first order. For example, the expression $\Phi(A)$, where Φ is a function of the second order and A is a two-place first order function, may also be represented as $\Phi_{xy}A(x,y)$, where Φ_{xy} is an operator of the first order with two directive variables x and y . On the other hand, the expression $\lim_{x \rightarrow \alpha} f(x)$, where \lim is an operator of the first order, may also be represented as $\lim(\alpha, f)$, where \lim is now a function of the second order with one individual argument and one function argument (of first order). In general, the functions of order $n+1$ are the same as the operators of order n . (Nevertheless, see the following.)

Second, when we apply functions of the second order (i.e., operator of first order) to functions of the first order to form a term or a formula, it is not that the former (of higher order) take the latter (of lower order) as arguments (so asserted by the prevailing opinion), but that the former become arguments of the latter, or at least that the former bind the empty places of the latter. In any event, we cannot say that the latter are arguments of the former. Hence the usual expressions $A_{x\alpha}(x)$ and $\lim_{x \rightarrow \alpha} f(x)$ should be written as $(\alpha A$ and $(f \lim \alpha$ or as $A\alpha(1)$ and $\lim a f(1)$. (We stipulate that if operators should be written after the scope they must be coupled with left parentheses.)

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980
pp 1-10]

Third, since the first order operators (i.e., functions of the second order) never take functions of the first order as arguments, there is no room to give rise to higher functions and operators. Hence we have only individuals, propositions, functions (of the first order) and operators (of the first order, i.e., functions of the second order). The extended predicate calculus would become much simpler.

TITLE: "Nonlinear Differential Equations in Electron Beam Focusing Theory
(II)"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese
Natural Sciences Edition No 1, 1980 pp 11-18

TEXT OF ENGLISH ABSTRACT: As a continuation of a previous paper, we use in this note the series expansion (4) of the periodic solution $\bar{u}(x)$ of (1) and (2) to study its stability. Our results agree very well with the experimental results of Mendel, Quate and Yocom. That is to say, when $0 < \alpha < 0.4$ or $0.658 < \alpha < 1$, $\bar{u}(x)$ is stable, and when $0.4 < \alpha < 0.658$, $\bar{u}(x)$ is unstable.

We have already seen that there exists a close relation between geometrical properties of the curve $u = u^0(x_0, \alpha)$ (which we wrote simply as $u = u^0(x_0)$, denoting the locus of the first minimum and maximum points of solutions of (1) and (2)) on the one hand, and the existence and number of periodic solutions of (1) and (2) on the other hand. Now, by means of numerical calculation, we

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980 pp 11-18]

find furthermore that when $\alpha = 0.4$, the shape of the curve undergoes a sudden change, i.e., when α increases and passes through the value 0.4, the curve $u = u^*(x_0, \alpha)$ changes from II to III. All these phenomena together with the stability properties described above deserve strict theoretical explanations.

Finally, we explain some known experimental results from the mathematical point of view, which is quite different from that of the engineers.

TITLE: "Asymptotic Solution of Singular Perturbation Mixed Problems for the Second Order Quasi-linear Hyperbolic Partial Differential Equations"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 19-30

TEXT OF ENGLISH ABSTRACT: In this paper we discuss mixed problems for the second order quasi-linear hyperbolic partial differential equations, which involve small parameters in the higher order derivatives. As $\epsilon = 0$, the original equations are degenerated into the lower order differential equation, and a part of the boundary conditions is lost. The problems of this type are called singular perturbation problems. We constructed an asymptotic solution to the presented problem and investigated the asymptotic behavior of the solution.

TITLE: "Radiocarbon Dating of Some Geophysical Samples in China"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in
Chinese Natural Sciences Edition No 1, 1980 pp 47-52

TEXT OF ENGLISH ABSTRACT: Some samples from different geological origins and different geological ages are dated by means of ^{14}C using liquid scintillator method. The samples range from buried old wood in glacier deposits at 4200 and 3900 meters above sea level in Xizang (Tibet), the wood in a karst cave of Guizhou Province and charcoal in civilization layers in Liyang of Jiangsu Province, with geological ages ranging from 1000 to 7000 years ago.

The carbon is first converted into calcium carbide at 980°C, then it is hydrolyzed into acetylene and converted into benzene using silica-alumina catalyst. The catalyst was activated in chromic acid before using. The scintillator has

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980 pp 47-52]

36 g PPO + 0.6 g POPOP dissolved in 1 liter of Xylene. One mixes 1 ml of scintillator in each 5 ml of benzene.

The purity of benzene is controlled by ex-radioactive source channel compare method. The samples are contained in teflon bottles of 8 ml in capacity and are viewed by two photomultipliers in coincidence counting circuits.

The counting time for each sample is 1000 minutes for each run. The data are corrected with Damon's table.

TITLE: "Investigations on A.C. Oscillographic Polarographic Titration. III. Titration of Zinc by EDTA and Ferrocyanide by Zinc"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 53-60

TEXT OF ENGLISH ABSTRACT: In this paper, it has been shown that the AC oscillographic polarographic titration can be applied advantageously to titrate Zn^{2+} by EDTA and ferrocyanide by Zn^{2+} . A thin film mercury electrode was used as the polarized electrode and Ag-coated Hg electrode as reference electrode. AC oscillographic polarographic titration was more rapid and accurate than the indicator methods. AC oscillographic titrations can be carried out in the presence of colored precipitates from ferric hydroxide and other reagents which interfere with the titration of indicator methods. Thus, zinc can be titrated in an ammonium solution in the presence of precipitates formed by sodium

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980

TITLE: "The Study of Characteristics of an Old Caldera and Its Associated Subvolcanic Granitic Body"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 97-120

TEXT OF ENGLISH ABSTRACT: This paper is a preliminary analysis of a late Jurassic caldera occurring in the vicinity of Zhongteng district. The caldera, being about 600 km² in area, is located at the intersection of two sets of fracture zones trending NE-SW and E-W respectively.

In the center of the caldera is a granitic stock covering an area of about 90 km². It possesses the features of a ring complex and is composed of

quartz-monzonite-diorite, quartz-monzonite including monzonitic granite and fine-grained granite from the outer to the inner ring. According to the geological occurrence and the characteristics of petrochemistry and mineral composition, it is clearly shown that the ring complex was formed by comagmatic activity through three stages of intrusion.

The country rocks of the Zhongteng igneous body consist principally of volcanics, ranging in composition from intermediate to acidic with a total thickness of about 1620 m, in which a great number of welded tuffaceous rocks constitutes three cooling units amounting to 1440 m in thickness. These volcanic rock series are concentrically distributed and dip inwardly around the central stock. It is believed that the Zhongteng caldera was formed through collapse on a large scale following the strong eruption of volcanic ash flows. The depth of collapse in the central part is estimated to be about 500 m. In addition, there are four parasitic volcanoes and two occult explosive bodies arranged in a semicircular pattern around the Zhongteng body.

The Zhongteng body was placed beneath the earth's surface at about 300-1100 m. In summing up the results concerning the texture of rocks, the temperature measuring of inclusions, the triclinity of potash feldspars, the coefficient of

oxidation and the widely developed columnar joints, it is suggested that the Zhongteng intrusive complex may be recognized as a typical subvolcanic body.

A number of petrochemical diagrams demonstrate that the volcano-intrusive complex in the Zhongteng area is characterized by the calc-alkaline rock series.

The writers are led to the conclusion that the rock series were virtually derived from the evolution of the andesitic magma which ascended from the top of the upper mantle along the fracture zones at the continental margin and remelted contemporaneously the continental crust to form abundant acidic melts. The successive eruption and intrusion activities evidently led to the Cu and Mo mineralization in the later phase of magmatic process.

TITLE: "Quaternary Environmental Changes in Eastern China"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 121-144

TEXT OF ENGLISH ABSTRACT: The climatic and environmental changes of eastern China may be summarized as follows:

(1) Plio-Pleistocene morphogenetic movements initiated glaciations in eastern China. Late Pliocene earth movements persisted strongly into the Pleistocene. Since the beginning of the Pleistocene period a new stage of earth history of China was set. The rise of the continent and the lowering of the sea level increased the albedo and the continentality. As the land relief became higher and higher Plio-Pleistocene conglomeratic deposits of "Molasse" type spread widely. The authors suggest that the conspicuous morphogenetic movement, chiefly great faulting movements in China, has fundamentally affected the pattern of global atmospheric circulation and led to the glacierization of different parts of China.

(2) There is a formidable amount of evidence from many different lines of

[Continuation of NANJING DAXUE XUEBAO Natural Sciences Edition No 1, 1980 pp 121-144]

research to show that during the glacial epoch the polar front and cyclone track shifted southward while the summer monsoon became much weaker. Late Pleistocene snowlines, lower limits of periglacial processes and boreal flora have depressed 1000-2000 meters. Between 30,000 years B.P. and 12,000 years B.P. the shift of the periglacial zone was about 1600 km and the periglacial environment dominated the eastern great plains and the adjoining mountainous regions north of 30°N.

The younger loess (Mulan loess of north China and the upper Shiashu loess of the Nanjing area) were accumulated during the Tali (Würm-Wisconsin) glaciation. The "Basal gravels" might have accumulated during the Emm interglacial, representing an intervening erosion phase. As revealed by pollen analysis, paleosols developed during the interglacial or interstadial periods. There is clear evidence throughout the Quaternary the climate became colder and drier. The Tali (late Würm) glaciation was the coldest and driest one. But the temperature of Lushan/Taku (Halstheim) interglacial was 4°C higher than it is now.

(3) A cold trough existed in eastern China during the Pleistocene ice age and the little ice age.

The Pleistocene snowline descended from the western regions to the east coast. When it reached the Lower Changjiang Valley, it steepened conspicuously. Late Pleistocene Mammuthus-Coelodonta Fauna moved southward to 34°N, showing their greatest southward extension in the world. Boreal vegetations are distributed at 2000-4000 m above sea level today, but descended to 450 m in the Late Pleistocene epoch near the east coast of Zhejiang. Quaternary glaciations and periglacial features have been found in mountainous regions adjoining the Lower Changjiang Valley. Abundant facts recorded in Chinese historical writings provide us with excellent references in studying the much colder climate of eastern China during the little ice age. All the facts mentioned above show the much greater horizontal and vertical displacement of the climatic belts in eastern China.

The territory where the greatest southward displacement of climatic belts has taken place might be defined as the "cold trough" of eastern China. The "cold trough" was vulnerable to the effects of climatic changes. The causal mechanism of the "cold trough" is fully discussed in this paper.

TITLE: "The Evapotranspiration and Supplementary Water Requirement of Paddy Fields in China"

SOURCE: Nanjing NANJING DAXUE XUEBAO [JOURNAL OF NANJING UNIVERSITY] in Chinese Natural Sciences Edition No 1, 1980 pp 145-159

TEXT OF ENGLISH ABSTRACT: In this paper, the evapotranspiration and supplementary water requirement of paddy fields for different cultivating periods in China are estimated from heat and water balance climatological methods. The results may be summarized as follows:

(1) The net radiation (R_0), evapotranspiration (E) and radiative dry index (R_0/Lr) of paddy fields for different cultivating periods in China are shown below:

	R_0 (Kcal/cm ²)	E (mm)	R_0/Lr
first cropping of rice in the double cropping rice system	17.5~22.5	300~400	0.5~1.0

second cropping of rice in the double cropping rice system	15~30	250~500	0.5~1.5
single cropping of rice:			
1. South cultivating region	20~30	350~550	0.5~1.0
2. North cultivating region	20~35	400~700	1.0~over 1.6
late maturing variety of single cropping of rice	27.5~42.5	450~700	0.5~1.5

(2) The critical radiative dry index $(R_0/Lr)_c$ needless of irrigation rapidly decreases with the increasing of percolation (P), and the slope of the correlative curve between $(R_0/Lr)_c$ and P gradually decreases with the increasing of R_0 . In the present condition of rainfall utilization, irrigation is necessary everywhere and in every cultivating period according to $(R_0/Lr)_c$ of the paddy fields during the cultivating period.

(3) The supplementary water requirement (M) of paddy fields during the cultivating period increases with increasing of P and R_0/Lr , but it increases more rapidly if R_0/Lr is below 1.0 than it does when R_0/Lr is above 1.0.

(4) The calculation shows that the ratio of the area of catchment to the area of paddy field (A_c/A_f) also increases rapidly with R_0/Lr and P.

TITLE: "Motion of Particles Suspended in Stationary Turbulent Medium at Large Reynolds Number"

SOURCE: Beijing KEXUE XUEBAO [SCIENCE BULLETIN] in English Vol 25 No 4,
Apr 80

EXCERPTS FROM ENGLISH ABSTRACT: The problem of motion of particles suspended in a turbulent medium is of great significance in the study of laser velocity measuring techniques, atmospheric pollution, formation of clouds and rain, and deposition of mud and sand. The key to the problem lies in the "follow-up" behavior of suspended particles with the surrounding medium. There is a great need for laser measuring techniques to determine flow velocity in the turbulence field so as to find a statistical criterion for a complete "follow-up," because only under this condition can suspended particles serve as flow velocity indicators.

[Continuation of KEXUE XUEBAO Vol 25 No 4, Apr 80]

By the "follow-up" behavior of suspended particles we mean the degree to which the velocity of suspended particles depends on, or reflects, that of the flow field. By analyzing the "follow-up" behavior of particles suspended in a known turbulence field, we have succeeded in finding a statistical criterion for complete "follow-up" of suspended particles with the surrounding medium.

TITLE: "Distribution of Tritium in Natural Water in China"

SOURCE: Beijing KEXUE XUEBAO [SCIENCE BULLETIN] in English Vol 25 No 4,
Apr 80

TEXT OF ENGLISH ABSTRACT: Tritium is a cosmogenic radioactive isotope of hydrogen. It originates from interactions between cosmic rays and the constituents of the upper atmosphere. The dominant nuclear reactions are $^{14}\text{N}(\text{n}, ^3\text{H})^{12}\text{C}$ and $^{16}\text{O}(\text{p}, ^3\text{H})^{14}\text{O}$, etc. By β^- -decay, ^3H , whose half-life is 12.26 years, may change into ^3He , a stable isotope of helium. When water molecules containing ^3H mix with the ordinary molecules of natural water, they circulate together. Since the 1950's, thermonuclear tests have become another important source of ^3H , so at present the majority of ^3H found in natural water comes from thermonuclear tests. As a subject of basic research, the scope of the study of the distribution of ^3H in natural water has now become so wide and important that it requires the coordinated efforts of scientists on an

[Continuation of KEXUE XUEBAO Vol 25 No 4, Apr 80]

international scale and has found practical applications in many fields. A large amount of data on ^3H has been accumulated in the world during the past 20 years, and the characteristics of its global distribution in natural water have been studied.

Fifty-six items of data on ^3H concentration in precipitation and surface water samples collected in China during May, 1978 are reported in this paper, and its geographical distribution based on these data is discussed.

SOURCE: Beijing KEXUE XUEBAO [SCIENCE BULLETIN] in English Vol 25 No 5, May 80

TEXT OF ENGLISH ABSTRACT: The CT6B device is a modification of the CT6A device. Its parameters are the same as the previous one, except that the copper shell is removed and a new vacuum chamber is assembled. The chamber is made of 2 mm rigid stainless steel sections welded together, with a ceramic break and a molybdenum limiter. There is a set of windings (called V-coils) for producing a vertical magnetic field and another (called H-coils) for compensating horizontal stray fields. The plasma displacement is measured by the so-called saddle coils and cosine coils. We have found that this method is better than the Mirnov probe method, especially for a shell-less Tokamak.

TITLE: "Effect of Transmission of Pulsed High-Power 10.6 μm Laser on
Atmosphere"

SOURCE: Beijing KEXUE XUEBAO [SCIENCE BULLETIN] in English Vol 25 No 6,
Jun 80

TEXT OF ENGLISH ABSTRACT: The presence of atmospheric kinetic cooling caused
by atmospheric absorption of 10.6 μm laser radiation has been proved through
theoretical analysis and experiments. Dreig expanded the work done by Wood et
al., and after considering the absorption saturation effect which was neglected
by Wood et al., obtained an analytic expression for atmospheric temperature
change caused by the atmospheric absorption of high-power CO₂ laser radiation.
However, they assumed the specific heat capacity at constant pressure and
volume respectively. Now some problems have been encountered in the process of
laser beam transmission through the actual atmosphere. Under what conditions
are the above assumptions to be made? Under what conditions can the absorption
saturation effect be neglected? Can a much more general analytic expression of
the atmospheric temperature change be derived? This paper is an attempt by the
author to answer these questions.

TITLE: "Laser Isotopic Enrichment of ³⁴SF₆ and the Preparation of ³⁴S"

SOURCE: Beijing KEXUE XUEBAO [SCIENCE BULLETIN] in English Vol 25 No 7, Jul 80

TEXT OF ENGLISH ABSTRACT: Recently there have been many reports on experiments of laser isotopic enrichment of SF₆ with infrared multiphoton dissociation. The aim of all these experiments is the determination of the relative contents of ³⁴SF₆/³²SF₆ in the residual gases by IR or mass spectra. The present paper is a report on what we have achieved along this line and our success in extracting S from enriched SF₆ through hydrolysis, separation, sodium reduction and iodine oxidation.

By using H₂ as a scavenger of laser-induced reactions, the products obtained were several low valent sulfur fluorides and HF. These products were converted

[Continuation of KEXUE XUEBAO Vol 25 No 7, Jul 80]

subsequently into SOF_2 and SiF_4 in glass containers in the presence of trace moisture. Our job in this is to separate the products induced by laser beams from enriched SF_6 and then to turn them into free sulfur.

Because SOF_2 and SiF_4 are easy to hydrolyze and the products of hydrolysis are acidic, we have made use of these properties by hydrolyzing the mixture of gases produced by irradiation and absorbing the new products with NaOH . The SF_6 in the mixture not hydrolyzed was reduced to Na_2S with metallic sodium. Na_2S was then oxidized by I_2 in a weak basic solution. Finally, by means of extracting with CS_2 , pure sulfur powder was obtained.

TITLE: "Sea Oscillation"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 2, Feb 80 pp 1-2

ABSTRACT: Using the experiences of 2 Japanese cargo ships sailing on the Pacific Ocean in Mar 33 and 17 Feb 59, this paper describes free oscillation of sea water caused by earthquake or volcanic eruption of the coastal region or the ocean floor. The wave [tsunami] has a vertical vibration characteristic, measuring only several km, but having a fast speed of about 1,400 m/sec. In China, ocean oscillation was recorded on 13 Feb 18 when a 7.5 earthquake occurred on the ocean floor (117°E and 23.5°N) near Nanwo of Guangdong. In recent years, mild oscillation also occurred in Bohai during the 7.4 earthquake in Bohai and again during the 7.8 earthquake in Tangshan. To date, there has been no record of destruction caused by ocean oscillation in China, however.

TITLE: "A Tragedy Caused by Mercury"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 4, Apr 80 pp 10-11

ABSTRACT: This paper relates the events occurred in Minamata, Japan in 1950 leading to the discovery of the Minamata Disease, a syndrome caused by methyl mercury poison. The paper proceeds to explain that when mercury containing waste of industry, agricultural drugs, and pharmaceuticals enters the atmosphere, the soil, and the water, the ocean finally receives the mercury. At present, more than 10,000 tons of mercury enters the oceans every year. After mercury is settled on the ocean floor, it is released at a rate of 1 percent per year and under the action of microorganisms, it is converted into methyl mercury to form a secondary pollution of the sea water. Methyl mercury is even more poisonous than mercury. The most effective method of preventing Minamata Disease is to treat the liquid waste that contains mercury. There is also the microorganism method, but the paper does not elaborate on it.

TITLE: "Mercury--A Monster Feared by Marine Organisms"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 5, May 80 pp 3-4

ABSTRACT: Mercury pollution of the ocean damages men mainly through eating contaminated seafood. This paper explains the way mercury in the sea enters the food chain. Like a monster, the mercury content of seawater seeps into the planktons, the fish and shellfish, the seabirds and sea animals and collects in the bodies of these organisms to reach a density several hundred times that of the sea water. If the methyl mercury content of the fish or seabird is transferred to a man, it will endanger his health or cause Minamata Disease. Most countries set limits of mercury content of fish or shellfish being sold on the markets. They are 0.5 mg/kg in USA and Canada and 1 mg/kg in Japan and Sweden.

TITLE: "Using Poison to Attack Poison for Pollution Control--Antidote Phenomenon"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 5, May 80 p 5

ABSTRACT: In a certain place of Southwest China, there is a plant using mercury as the raw material. Under the sunlight, pearl-like quicksilver may be seen on the roads near the plant. This is, without doubt, a region of mercury pollution. The inhabitants are happy and healthy, and no one is suffering from Minamata Disease, however. Research disclosed the fact that the mercury content of the hair of local residents reaches 5-10 mg/kg and that of the workers of the plant is 10 mg/kg. The soil and the water of the region contain higher than normal selenium, which interferes with the physiological action of mercury in the organic body. When 10 mg/kg of mercury was fed to experimental mice, all died, but when 0.5 mg/kg of selenium was added to the same dose of mercury, not a single mouse was poisoned. The paper also mentions other antidote relationships, including gold and copper, calcium and lead, lithium and sodium, etc.

TITLE: "What Hit Shanfeng to Cause the Explosion?"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 6, Jun 80 pp 1-2

ABSTRACT: On 1 Jul 78, at noon, when the 13,000 ton dredge, Shanfeng, was about to finish its work at sea just outside of the estuary of the Yangzi, there suddenly was an undersea explosion. The dredge was damaged, but no one was hurt badly. It was suspected that the suction rod of the dredge may have hit an underwater mine. Many of these were known to have been laid in the region of the sea by Japan, the USA, and the Kuomintang during WWII and just before the liberation. A Japanese ship was sunk in Jul 44 and a Chinese ship in 1948 by these leftover mines. In 1950, mine sweepers uncovered 7, but they all appeared to be too corroded to be operative, but one MK-26 picked up in 1965 appeared to be undamaged. In view of the fact that the shell fragments on the deck of Shanfeng are 2mm in thickness and having shining inner wall, it is believed that the culprit must be a MK-26. Obviously, many of the 600-700 mines laid by the USA in various points of the Yangzi must still be operative.

TITLE: "On Underwater Welding"

SOURCE: Beijing HAIYANG [OCEANS] in Chinese No 6, Jun 80 pp 4-5

ABSTRACT: Underwater welding is needed for emergency repair of ships, salvaging, bridge construction, building large oil drilling platforms, laying underwater pipes, etc. Difficulties of underwater welding include darkness, pressure, and fast cooling speed, etc. There are now 3 types of underwater welding techniques. The most primitive is the wet method, which is safe and inexpensive, but air bubbles may easily occur to cause it unsuitable for welding important structures. The second is the local dry method, using inert gas in a cover. The humidity often causes the cover to be too cloudy for the welder to see. The third is the dry method, using a sealed and pressurized chamber, with all of the water in the chamber pumped out. With this method welding is possible in a depth of 100-300 m, with the quality almost as good as on land. The cost is very great, however. One such chamber in Japan has a price tag of 10 billion.

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 1-12

TEXT OF ENGLISH ABSTRACT: From working and failure conditions of the cold-forging hex nut die, a study using water-containing urea to tuftride the die to improve its working life is made. It shows that the life of Cr_{12}MoV dies is improved from 60,000~80,000 nuts per die of ordinary treated but non-tuftrided to 330,000~485,000 nuts per tuftrided. This is discussed qualitatively on the basis of optical-, electron-microscopic and ion-probe analyses. Due to the existence of compounds of carbon, nitrogen and oxygen in surface layers formed

[Continuation of ZHEJIANG DAXUE XUEBAO No 1, Mar 80 pp 1-12]

in the process of water-containing urea tuftriding, the hardness and toughness of the dies are increased, the coefficient of friction is decreased, the formation and expansion rate of "indentation" on the working surfaces of the dies are reduced, and hence the working life of the dies is prolonged.

TITLE: "Thin Depth Gas Carbonitriding for Ferrule of Bite Fitting"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 13-23

TEXT OF ENGLISH ABSTRACT: This paper discusses the thin depth (0.03-0.05 mm) gas carbonitriding process for a thin wall of ferrule, in which triethanalamine liquid drops were fed into a reformed shaft furnace. The ferrules were carbonitrided at 800°C for five minutes which was followed by oil quenching. After tempering at 180°C for one hour, the surface hardness thus obtained was approximately Hv 800. Since the carbonitriding temperature is relatively low, the distortion of the ferrule is very small with the change in diameter of the ferrule less than 0.03 mm. After treatment, the ferrule is very tough with more austenite on its surface and less martensite in its core.

TITLE: "Extraction Spectrophotometric Determination of Gallium in Stone Coal"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 38-47

TEXT OF ENGLISH ABSTRACT: To meet the need of analysis of gallium in stone coal abundant in our province, the improvement of the extraction spectrophotometric determination of gallium with Rhodamine B was investigated. The proposed method utilizes a small amount of sample and it is fused with the alkali directly (without the demand of ignition to remove carbon). Moisten the melt with hydrochloric acid and evaporate the solution to dryness. Transfer the residue into a colorimetric tube with hydrochloric acid (5.0-5.5 N). Add the titanium trichloride and Rhodamine B respectively and extract it into a mixed solvent (benzene and ether). Then the absorbence is measured. This method is relatively easy, rapid and sensitive and is applicable to the determination of 0.5~50 PPM gallium. For a sample containing 0.001 percent gallium the relative error is ± 10 percent.

TITLE: "A Graphical Method to Solve the Eigenvalue Equations of the Thin-film Optical Waveguide"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 57-64

TEXT OF ENGLISH ABSTRACT: In this paper, a graphical method to solve the eigenvalue equations of the thin-film optical waveguide is proposed. This method can be applied to the thin-film optical waveguide of arbitrary parameters.

The eigenvalue equation of the TE mode of one-dimensional waveguide stands; it is a transcendental equation and for its solution the author introduces two dimensionless parameters, ξ and η . The equation is then transformed into a system of two equations. The former is a set of straight lines and the latter is a family of curves. The point of intersection of straight and curved lines gives the solution to the eigenvalue equation.

To the designers of integrated optical circuits it is important to know the

[Continuation of ZHEJIANG DAXUE XUEBAO No 1, Mar 80 pp 57-64]

dispersive character of the waveguide. Hence the solution between the effective index of refraction and the dimensionless parameter of the waveguide is derived. This relationship is represented by a circle in the Cartesian coordinates. Through the geometrical relation furnished by this circle, it is very easy to describe the characteristic curves of dispersion of the waveguide. The process of drawing the dispersive curve is shown. Also shown is the TE mode dispersive characteristics derived from the graphical method in this paper.

The eigenvalue equation of the TM mode of one-dimensional thin-film optical waveguide can also be solved by the method similar to that of the TE mode. The results are also given in this paper.

In conclusion, the graphical method shows itself as a useful auxiliary means of interpreting the thin-film optical waveguide. Through the analysis of the geometrical relation, the author has also obtained the explicit solution of the cut-off wavelength of the TE and TM modes as shown.

TITLE: "The Time Mark Generator of Solid Luminescent Diode"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 65-70

TEXT OF ENGLISH ABSTRACT: An integrated design of a time mark generator with high precision, high stability and high frequency was suggested. Obtained from the quartz crystal oscillator through the dividing network system as a driving source, the use of the GaAsP solid luminescent diode as the pulse light source and the use of the signal have advantages over other methods (mechanical, neon light tubes, discharge sparking, etc.). These advantages are: lighter in weight, smaller in size, better in anti-seismicity and less driving power. Because the luminescence wavelength coincides well with the wavelength peak of the film sensitization curve, the time mark frequency is very high (to 30 kc/sec) and more stable. This generator is designed especially for the slit mode high-speed camera, and it can also be used for other synchrocameras.

TITLE: "Calculating the Critical Speed of a Rotating Shaft by the Finite Element Method"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 71-82

TEXT OF ENGLISH ABSTRACT: A calculation of the critical speed of a rotating disk and shaft system is obtained by FEM. The portions of disk and shaft of variable sections are described approximately by conical portions respectively. The displacement in the element is interpolated by a three-order polynomial function. In the calculation, the gyroscopic moment of the disk and shaft is taken into consideration. As for the vanes (straight and torsional), a suitable simplification is made. The influences of shaft shear and the oil film rigidity of the bearing are neglected, and the bearing surface is considered rigid.

This paper discusses a suitable method by which to calculate the critical speed of complex and multi-span rotating shafts. The computer program input

[Continuation of ZHEJIANG DAXUE XUEBAO No 1, Mar 80 pp 71-82]

requires only the information of constants of the material properties, the dimensions of elements, the number of elements and nodal points. Therefore, it is convenient to use. This method enables us to calculate the lowest critical speeds and modes.

TITLE: "OTF and Revolution of the Rotating-Mirror Camera Framing at High Speed"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 83-92

TEXT OF ENGLISH ABSTRACT: This paper discusses how the optical transfer function (OTF) of the rotating-mirror camera framing at high speed, scanning with a diamond or rectangular-shaped aperture, has been computed for out-of-focus images. The results are analyzed and compared, and taking the transfer function into consideration, the revolution of the camera which contains film is briefly discussed.

TITLE: "Calculation of the Capacity of Rectifier Transformer in T-connection"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 93-112

TEXT OF ENGLISH ABSTRACT: This article deals with the principle of operating T-connected transformers, and also presents the derivation of the formulae for calculating the capacity of these transformers especially designed for rectifier operation, assuming that the rectifier circuit is in ideal operating condition. It concludes with the corrections made on the formulae for calculating the no-load average voltage U_{d0} taking into consideration the factors which have hitherto been neglected.

TITLE: "On Opial Inequality"

SOURCE: Hangzhou ZHEJIANG DAXUE XUEBAO [JOURNAL OF ZHEJIANG UNIVERSITY] in Chinese No 1, Mar 80 pp 120-124

TEXT OF ENGLISH ABSTRACT: HUA Luogeng [3478 3012 1649] has proved the generalized Opial inequality:

$$\int_0^a |y(x)|^t \cdot |y'(x)| dx \leq \frac{a^t}{1+t} \int_0^a |y'(x)|^{1+t} dx,$$

where $y(x)$ is an absolutely continuous function on $(0, a)$, $y(0) = 0$ and t is a positive integer.

He conjectured that the above inequality might hold for all positive real numbers t . We have proved this conjecture is true.

TITLE: "The Huangpu New Harbor Under Construction"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 4, Apr 80 pp 1-2

ABSTRACT: The Huangpu New Harbor is a new construction project of the Huangpu Harbor Affairs Management Bureau of the Ministry of Transportation. Premier ZHOU proposed in 1973 that the appearance of China's harbors must change within 3 years, and the Command Department of Huangpu New Harbor Construction was established the same year with almost immediate ground breaking. The first stage of the project was completed in the end of 1975. Now, on the eastern shore of the Pearl River estuary, the harbor has 5 booths for mooring ships of the 20,000 ton class and additional mooring spaces measuring more than 1,000 m in length. In addition, there are one wharf for oil tankers only, a railway station, and a 14 plus km of special rail line. Grain elevators of a capacity of 300,000 tons and more than 70 loading equipment of all sizes are now all operational. The second stage currently under construction will include 2 container docks measuring 470 x 380 m each. A photo of the grain elevators and another of the second stage engineering project are included in the description.

TITLE: "Nuclear Electromagnetic Pulse Effect--A Strange Occurrence in Hawaii"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 4, Apr 80 pp 38-40, 33

ABSTRACT: On 9 Jul 62, the lighting transformer on the island of Oahu in Hawaii was suddenly burnt up by a surge of power of unknown origin to cause the lights of 30 streets on the island to be out of commission, and at the same time, several hundred burglar alarms on the island of Honolulu all suddenly went off while the circuit breakers all flipped like a corn popper. Following investigation, it was known that these events were caused by a high atmosphere nuclear explosion test conducted by the USA government in the Johnston Island of the Pacific Ocean. This nuclear explosion, 400 km above the ground surface of an equivalent of 1,400,000 tons of TNT caused damage to electrical installations on the ground surface and the solar batteries and electronic instruments on several orbiting artificial satellites to be prematurely out of commission. Previously, in 1960, a high altitude nuclear explosion in the USSR had caused radar and long distance communication systems to be not operational for as long as 24 hours. This paper describes the incident in Hawaii and the theory and the aftereffects of such events.

TITLE: "Ultrasonic Microscope"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 5, May 80 pp 3-4

ABSTRACT: Optical microscopes can be used to observe light permeable objects or the surface of opaque objects. Electron microscopes can also be used to observe translucent objects while scanning electron microscopes can only be used to observe the surface of opaque objects. For the purpose of searching for a new technique of a capability of observing the internal structure of opaque objects, the ultrasonic microscope was born. Ultrasound has good penetration ability and has long been used to test internal defects of metal parts or concrete members. In medicine, it has been used to detect disorders of internal organs. But, in these applications, the millimeter ultrasonic wave is used. The newly created ultrasonic microscope uses micromillimeter wave and the length of the sonic wave in the most advanced ultrasonic microscope may reach 0.5 μ m or shorter, with a differentiation comparable with optical microscopes. This paper explains the work principle and the application prospects of ultrasonic microscopes.

TITLE: "A Strange Rock in the Forest"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 5, May 80 pp 5-7

ABSTRACT: This paper starts with a fictional telephone report of a patrolman to his commanding officer about his discovery of a strange rock in the jungle. Two horns grew out of the rock right under his eyes. He was told to bring the rock to the headquarters. When it arrived, the horns had retreated and it looked just like an ordinary rock, but after a little while, a pair of horns gradually extended from the rock and stayed out for 5 minutes. Inside the rock, it was discovered, there was a tape recorder and analysis of the tape revealed that all conversations, movements of tanks, etc. in the vicinity of the rock in the jungle had been recorded onto the tape. The rock is in fact an automatic detective station gathering intelligence by itself. In 1973, the paper claims, the USA had dropped from the air many such automatic intelligence devices disguised as rocks, briks, or stumps of rotten wood to gather and transmit intelligence data from behind the enemy lines in Vietnam. Process of dropping such devices, data gathering, and data transmission and reception are briefly described.

TITLE: "Transportation Vehicles in a Tube"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 5, May 80
pp 18-19

ABSTRACT: In the early 1970's, the USA and Japan cooperated in an experiment to construct a pneumatic tube to transport merchandise containers. This type of tube transportation system requires a high initial investment. In the designing process, considerations must be given to preventing obstructions from occurring midway in the tube and to the method of retrieving the container if any accident should occur. Following prolonged experimentation, the tube is now operational [The paper does not mention the location of the experiment.] Most recently, the New Japan Iron and Steel Company constructed a tube line to deliver lime in containers at its second steel mill. The line has a capacity of 20,000 tons per month, operating 500 hours. The tube measures 609.6 mm in diameter and 1.5 km in length. A train of 2 containers carrying 500 kg is dispatched every 45 sec, to reach its destination in 6-8 sec. There is one air compressor and 12 auxiliary compressors to provide the air pressure. The paper suggests that the research and application of this technology may contribute to China's modernization.

TITLE: "Further Discussion on the Science of Chimneys"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 5, May 80
pp 31-36

ABSTRACT: After the paper, "The Science of Chimneys" was published in the journal, the editorial department has received many letters from readers asking questions on matters concerning chimneys that were not touched or not sufficient explained in that paper. This paper attempts to answer these questions. The questions include the cause of leaks in chimneys, the reason for a chimney to leak sometimes and not leak at other times, the method and structure of dust trapping devices installed in the chimney, and the structure and method of installing automatic valve to guarantee an upward draft.

TITLE: "For Controlled Growth of a Single Atom Layer--Successful Research and Manufacture of China's First Molecular Beam Epitaxy [MBE]"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 6, Jun 80 pp 1-2

ABSTRACT: In the past decade, MBE technology has grown into a very active field, and commercial equipment is being sold by the USA, England, and France. Chinese scientists began research and designing in 1974, and the first MBE equipment made in China has been successfully completed in 1979. This paper explains the technology briefly, including its advantages over gaseous epitaxy. The importance of epitaxy in manufacturing semiconductors forms the first section of the paper. The paper also includes a drawing of the super-vacuum portion of the MBE equipment, and another drawing [not a photo] of the MBE equipment made in China. But, there is no mention of the organization that succeeded in making the first MBE equipment, nor the names of scientists who participated in the project.

TITLE: "What is an Asphyxiation Bomb? Introducing the Fuel Air Bomb"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 6, Jun 80 pp 22-23

ABSTRACT: As a matter of fact, the paper says, the USA has long been studying a weapon called the "fuel air bomb." Since 1967, it has been repeatedly used on battlefields. Aside from TNT, etc. there are many other combustible materials, such as easily inflammable solid powdery dust of aluminum, coal, etc. when it is suspended in the air, it will cause explosion when the condition is suitable. The fact that a mixture of certain inflammable gas and air in a given ratio will explode has been known long time ago from experience of coal and oil mining accidents. This is the theory behind the fuel air explosive (FAE) which began to appear in the 1960's. This paper discusses the method of making such bombs and their advantages and shortcomings.

TITLE: "Intercontinental Ballistic Missile"

SOURCE: Beijing KEXUE SHIYAN [SCIENTIFIC EXPERIMENT] in Chinese No 7, Jul 80
pp 37-39

ABSTRACT: Intercontinental ballistic missiles began to be developed after the WWII on the basis of the V-2 rockets of Germany. By 1978, the USSR had 1,400 intercontinental ballistic missiles with 4500 of these having nuclear warheads; the USA has 1054, with 11,000 nuclear warheads [?]. To date, intercontinental ballistic missiles may be divided into 4 generations. The history of development of intercontinental ballistic missiles is briefly told. The fact that a minute miscalculation at the launching site may cause a thousand mile mistake from the target is discussed. The paper begins with an explanation of intercontinental ballistic missiles, their trajectory, the passive segment of the flight, the altitude of the flight, the reentry, the maximum speed, etc.
